

## Part I (due Friday, April 19 at the beginning of class)

So that we have some more time to spend on some important topics, here's the result and proof I asked you to think about at the end of class Wednesday:

**Theorem 1.** *Let  $A$  and  $B$  be  $n \times n$  matrices. Then  $\det(AB) = \det(A) \det(B)$ .*

*Proof.*

**Case 1:**  $A$  is not invertible.

Then  $\det(A) = 0 \implies \det(A) \det(B) = 0$ .

Also,  $AB$  is not invertible, which implies that  $\det(AB) = 0$ .

**Case 2:**  $A$  is invertible.

Then there are elementary matrices  $E_1, \dots, E_r$  such that  $A = E_1 E_2 \cdots E_r$ .

So we have

$$\begin{aligned} \det(AB) &= \det(E_1 E_2 \cdots E_r B) \\ &= \det(E_1) \det(E_2) \cdots \det(E_r) \det(B) \\ &= \det(E_1 E_2 \cdots E_r) \det(B) \\ &= \det(A) \det(B) \end{aligned}$$

□

And one more result:

**Theorem 2.** *If  $A$  is invertible, then  $\det(A^{-1}) = \frac{1}{\det(A)}$ .*

*Proof.* Since  $A^{-1}A = I$ , we have  $\det(A^{-1}A) = \det(I) \implies \det(A^{-1}) \det(A) = 1 \implies$  (since  $\det(A) \neq 0$ )  
 $\det(A^{-1}) = \frac{1}{\det(A)}$ . □

You don't need to turn anything in for Part I this time, but bring any questions you have on this reading.

## Part II

No Part II this time.

**Part III: Homework (due Wednesday, April 24 at the beginning of class)**

1. Here's another use for determinants:

**Theorem 3** (Cramer's Rule). *If  $A\vec{x} = \vec{b}$  is an  $n \times n$  linear system such that  $\det(A) \neq 0$ , then the system has a unique solution, specifically:*

$$x_1 = \frac{\det(A_1)}{\det(A)}, x_2 = \frac{\det(A_2)}{\det(A)}, \dots, x_n = \frac{\det(A_n)}{\det(A)},$$

where  $A_j$  is the matrix obtained by replacing the  $j$ th column of  $A$  by the column  $\vec{b}$ .

Use Cramer's Rule to find  $x_2$  in the following system.

$$3x_1 - 2x_2 = 6$$

$$-5x_1 + 4x_2 = 8$$

2. Let  $A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$ , where  $a, b, c, d, e, f, g, h, i \in \mathbb{R}$  and  $\det(A) = -7$ . Find the following:

(a)  $\det(3A)$

(b)  $\det(A^{-1})$

(c)  $\det(2A^{-1})$

(d)  $\det(2A)^{-1}$

(e)  $\det \left( \begin{bmatrix} a & g & d \\ b & h & e \\ c & i & f \end{bmatrix} \right)$

**Running list of vocabulary words that could be a quiz word**

- linear equation
- system of linear equations
- linear combination of a set of vectors
- span of a set of vectors
- linearly independent
- linearly dependent
- reduced row echelon form
- pivot
- homogeneous system
- free variable
- row equivalent

- consistent system
- inconsistent system
- trace of a matrix
- transpose of a matrix
- inverse of a matrix
- elementary matrix
- transformation
- domain
- codomain
- range
- vector space (I will not ever ask you to define this on a quiz—the definition is way too long—but you should make sure you know what makes something a vector space)
- subspace
- basis
- finite-dimensional vector space
- dimension
- coordinate vector
- column space of  $A$
- row space of  $A$
- null space of  $A$
- rank
- nullity
- linear transformation
- kernel
- range
- isomorphism
- isomorphic vector spaces
